

The background of the image is a dark, blurred screenshot of a financial trading interface. It features various data points, including a large red box with the number '75.65', a green box with '38,171', and other numerical values like '65.7' and '5.575'. There are also candlestick charts and line graphs visible, suggesting a complex market analysis environment.

JUMP INDEX: UNDER 3 & UNDER 4 STRATEGY

Unlock insights into Deriv Synthetic Indices with Georgetown's D-Circles Analysis. This guide focuses on predicting digit outcomes for the Jump Index, leveraging statistical imbalances for strategic trading.

Authored by Georgetown (Georgetown Digits Flow), this strategy is based on a data snapshot of the last 1000 ticks from real-time market analysis.

Market Analysis: Jump 10 Index

On February 26th, 2026, analysis of the Jump 10 Index over 1000 ticks revealed a statistical imbalance favoring lower digits (0, 1, 2, 3).

Under 4 Market

Digits 0,1,2,3 show a combined frequency of 40.8%, a significant edge over the 40% statistical norm.

Strongest Candidates

Digits 0, 1, and 2 are performing above their expected 10% average, indicating a short-term statistical bias.

Digit 3

Slightly underperforming but still contributes to the overall "Under" strength.

Strategy Framework: Confluence Model

This strategy uses a Confluence Model, combining digit momentum, group analysis, and price confirmation. We identify short-term statistical imbalances and ride them with strict discipline, rather than predicting market movements.

Primary Focus

Under 4 (Digits 0, 1, 2, 3)

Secondary Focus

Under 3 (Digits 0, 1, 2) – A tighter, higher-probability filter.

Entry Conditions: Your "A+ Setup"

For a valid trade on the Jump 10 Index, all conditions must be met. This ensures high-probability setups and disciplined execution.

Digit Circle Analysis

At least 3 of 4 (Under 4) or 2 of 3 (Under 3) digits must show GREEN momentum bars. No strong red bars in target digits.

Percentage Confirmation

Each target digit at or above 10.0%, and the total group percentage trending upwards over the last 50-100 ticks.

Price Action Confirmation

1-second price chart must be in a micro-downtrend (lower highs, lower lows). Do not trade "Under" if the price is in an uptrend.

Opposite Group Status

Opposing digits (4-9) should show mixed or weak momentum. Avoid if the "Over" group shows strong green momentum.

Execution Rules: Trade Parameters

Adhere strictly to these fixed trade parameters for consistent results.
Discipline in execution is paramount for this strategy's success.

Parameter	Setting
Market	Jump 10 Index
Contract Type	Digit Over/Under
Prediction	Under 4 or Under 3
Duration	5-10 ticks (scalp) or 1 minute (swing)
Stake	FIXED (e.g., \$1 or 1% of capital). Never change.
Stop-Loss	MANDATORY. Exit if trade moves against you by 3-4 ticks OR if momentum bars turn red.

Profit Target & Exit Strategy

Knowing when to exit is as crucial as knowing when to enter. Follow these rules to lock in profits and manage losses effectively.

Trade in Your Favor

Exit after 5-10 ticks or at the first sign of red momentum bars for your group.

Stop-Loss Hit

Accept the loss. Close the platform for a mandatory 30-minute break. No exceptions.

Session Target Reached

If you hit your 2-4% profit target, WITHDRAW PROFITS immediately and stop trading.

Psychology & Discipline

This strategy's success hinges on strict adherence to psychological rules. Discipline first, profits later.

No Revenge Trading

After a loss, walk away. The market will be there tomorrow.

No Screenshots

Success is measured by withdrawals, not balance numbers. Share only withdrawal slips.

Trade Only Your Sessions

Stick to predefined session times. If you miss a window, wait for the next.

Close the Laptop

When your session ends, profit target hit, or stop-loss triggered, physically close the laptop to protect capital from impulses.

Trust the Process

This strategy has an edge over thousands of ticks. Trust the math, not your emotions.

Risk Management Summary

Effective risk management is the cornerstone of sustainable trading. Implement these rules to protect your capital and ensure long-term profitability.

Concept	Rule
Per-Trade Risk	1% of session capital (fixed stake)
Per-Session Loss Limit	2-3% of session capital (if hit, stop trading)
Per-Session Profit Target	2-5% (if hit, withdraw and stop)
Daily Session Limit	Maximum 2-3 sessions per day (to prevent fatigue)
Withdrawal Rule	Always withdraw profits immediately after hitting target.

Final Checklist: Before Each Trade

Answer these 5 questions before clicking "Buy." If ALL answers are YES, execute. If ANY answer is NO, close the laptop and wait.

- Are 3 of the 4 Under digits (0,1,2,3) showing GREEN bars?
 - Is the 1-second price chart in a DOWN'Trend?
 - Is my fixed stake set and stop-loss in place?
 - Am I trading during my scheduled session time?
 - Am I calm, disciplined, and not seeking revenge?
- 

About This Strategy

Developed through live market analysis on February 26th, 2026, this strategy uses digit momentum, group analysis, and trader psychology. Synthetic indices are generated by a Random Number Generator (RNG); this strategy identifies short-term statistical imbalances, not certainties.

Consistent profits come from disciplined execution over hundreds of trades, not from winning every single trade. Trade Smart. Stay Disciplined. Withdraw Often.
